Global Trading Partners NA, Inc. of New Jersey is pleased to announce the following product line. Please contact us for further information at cmboyer@globaltradingpartnersna.com

Think about home. Think about being away from home or business, traveling the roads of another continent, far away from all that makes home a special place.

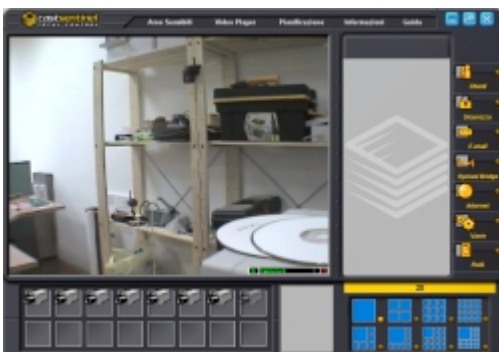

And now think about taking your home or business with you, wherever you go, through your mobile phone.

Introducing, the revolutionary video surveillance system that lets you monitor and protect your home and your loved ones 24 hours a day, through the ease and convenience of your mobile phone.

Real-time protection, real-time peace of mind.

‘State of the art’ video surveillance mobile related applications. We live in a busy society and cell phones are a major part of our every day life. This is why we have developed a web-based video monitoring system, unlike any other product on the market to date. The differences between our system and a competitors DVR system are as follows; monitor video from a PC anywhere in the world, set recording zones with variable sensitivity, run black and white, color or infra-red wired or wireless cameras. The key to our product is you can monitor your system from your Cell phone! You can enable to receive e-mail alerts directly to your phone when a zone starts recording, and be able to watch it on your cell phone **live!**

Just think of the piece of mind you can achieve...set a zone above a cash register, whenever there's motion in the area, it will record. Set a camera in any hidden corners of your business. Not only is this a great loss prevention tool, it can also be used for training staff. Imagine your security staff walking around your premises with a hand held monitoring device, tracking up to 16 different locations at the same time. Having the ability to help in a situation before it becomes a problem.

A video-surveillance system that monitors your home and office 24 hours a day, helping you protect your property and much more.

You can see and keep control of every room in your house - monitor your children's activities, check up on the condition of sick or elderly persons.

But there is more, a revolutionary novelty that represents the true soul of this system: you are in control, no matter how far away from home you are. With the help of a mobile phone or a pocket PC or even an Internet connection, you are in command.

Residential use: Price point makes either system quite affordable for the general public. Checking on the kids when you're out of town, checking with the baby sitter, knowing exactly when there is an intruder, multifunctional controls: alarm system, cctv system (PTZ), lighting, appliances, opening of doors, gates etc.

Franchise Owners: We feel that business owners do not sleep well at night knowing that their investment is left in the hands of their staff. It would be an advantage to see the problem real-time instead of the next day. Also knowing exactly when the doors are opened/closed for business. Reduce theft and damage to property, of course will be a deterrent.

Building Security, the ability to walk around the property and be at point A while monitoring point B. It will give the client a more total control, sort of a comfort zone if you will. Keep security risks low as well as insurance.

This will reduce the amount of false alarm problems; also get the authorities to the site quicker if Video notification is present.

FOG - available in the USA soon

A revolutionary security solution that emits a dense impenetrable non-toxic fog effectively hiding all valuables in the protected area. With the surroundings covered with fog, the intruder will not be able to see anything beyond 8 inches (20 cm) and thus will not be able to take any valuables. The fog, created in seconds, consists of billions of microscopic particles that create the illusion of "fog". The fog is non-toxic, non-conductive and most importantly non-contaminating. Together with the Sound Barriers, the intruder stands no chance since his primary senses will be attacked, therefore rendering him helpless. His first instinct will be to flee the scene either as a stand alone security system or be integrated with your existing security system. Day time the FOG can machine can be activated using either a panic button switch or a wireless remote device which will then quickly conceal the area you want to secure. Night time the FOG can also be integrated with any motion or intrusion detectors and any digital keypad which will trigger the FOG and then seal off the area with its thick fog. It can be activated simply from your cell phone everywhere in every time.

RP1 - 2 burglars smash their way inside a business establishment

RP2 - The man jumps over the counter and triggers the smoke system

RP3 - He recovers his wits and jumps over the counter chasing after his fleeing accomplice

RP4 - The break-in is over. The thieves have been forced out and nothing has been stolen.
